OHWL: Dark water stain on
log and sediment erosion

Appendix A: Field data form

General Information

Site/Project: Wapato Valley /
 Name/Owner: Plas Newbold Farm
 Location: Lewis River
 Description: 45.85357, -122.776643
points: LR-F-(1-3)

The following field form is for use in the field to help in making ordinary high water mark delineations on streams. The form should be used as a guide. A team consisting of a hydrologist/ geomorphologist and a biologist may be needed to accurately determine the ordinary high water mark.

General Observations: Day of Site Visit

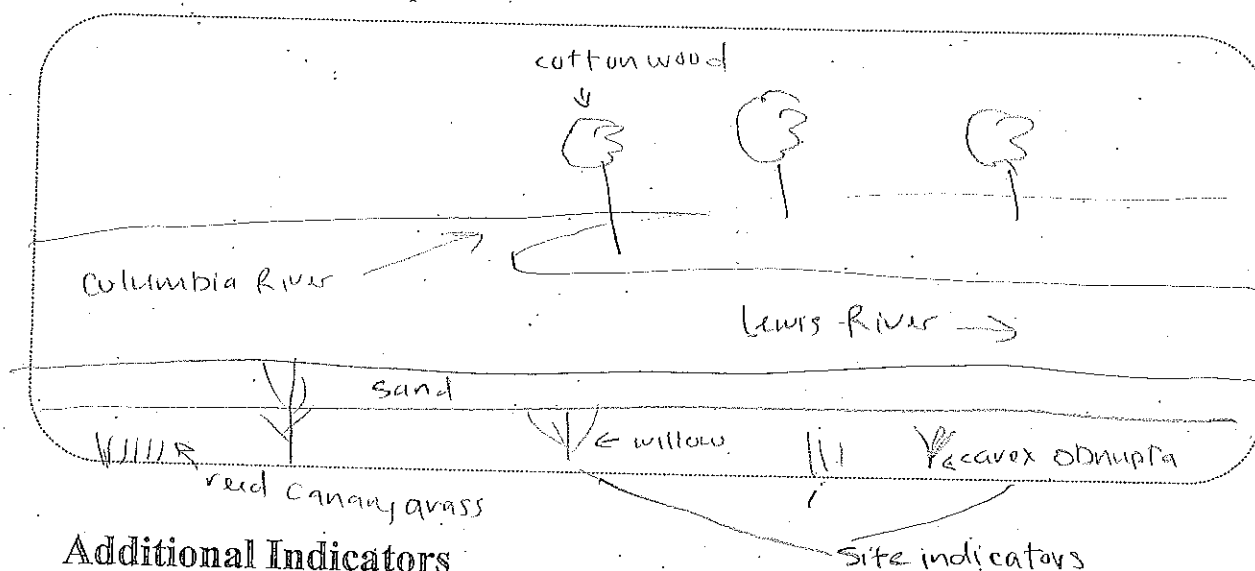

Date of site visit:	20 Nov 2019		
Time of site visit:	10:42		
Weather conditions:	Full Sun		
Watershed development:	Highly developed <input checked="" type="radio"/>	Mod. Developed <input type="radio"/>	Undeveloped <input type="radio"/>
Reach development:	Highly developed <input checked="" type="radio"/>	Mod. Developed <input type="radio"/>	Undeveloped <input type="radio"/>
Recent site disturbance?	No <input checked="" type="radio"/>	Yes <input type="radio"/>	Describe:
Upstream flow control devices?	No <input type="radio"/>	Yes <input checked="" type="radio"/>	Describe: Merwin Dam / Bonville Dam
Bank armoring at the site?	No <input checked="" type="radio"/>	Yes <input type="radio"/>	Describe:
Bank armoring up or downstream?	No <input type="radio"/>	Yes <input checked="" type="radio"/>	Describe: upstream
Observable tidal backwater?	No <input type="radio"/>	Yes <input checked="" type="radio"/>	
In-water structures? (i.e. bridge pilings, railroad embankments)	No <input type="radio"/>	Yes <input checked="" type="radio"/>	Describe: Piling upstream
Animals grazing in riparian zone?	No <input checked="" type="radio"/>	Yes <input type="radio"/>	Describe:
Observable beaver activity?	No <input type="radio"/>	Yes <input checked="" type="radio"/>	Describe: Beaver chews

Complete Vegetation Transects

- Use guidelines in Chapter 4 to complete vegetation transects.
- Determine upper and lower bounds of the OHWM from vegetation transects.
- After completing vegetation transects, look for more field indicators near the upper and lower bounds of the OHWM. Use the checklist as guidance.

Sketch

If a simple site, sketch a cross-sectional diagram of the site below. Include location of the waterway and upper and lower bounds of the OHWM defined by the vegetation communities or other OHWM indicators. Page 3 of the data form can be used for more complex sketches

Additional Indicators

Check the indicators that are observable at the site that provide rationale for establishing the OHWM at this location. The rationale should be described in detail in the report and should be supported with photographs taken during the site visit.

	Soil and geomorphic indicators ²⁴	Vegetative indicators ²⁵	Other indicators
Below OHWM	<ul style="list-style-type: none"> ○ Sediment bars ○ Scour line ○ Clean cobbles/boulders. ✗ Bank erosion/scour ✗ Lack of soil horizons 	<ul style="list-style-type: none"> Vegetation tolerant of inundation or high flow disturbances such as: ○ Willows ○ Black cottonwood ○ Japanese knotweed ○ Skunk cabbage ✗ Aquatic plants 	<ul style="list-style-type: none"> ✗ Exposed roots/root scour ○ Drainage patterns, as shown by flattened vegetation. ✗ Aquatic animals ○ Algal mats ○ Iron staining

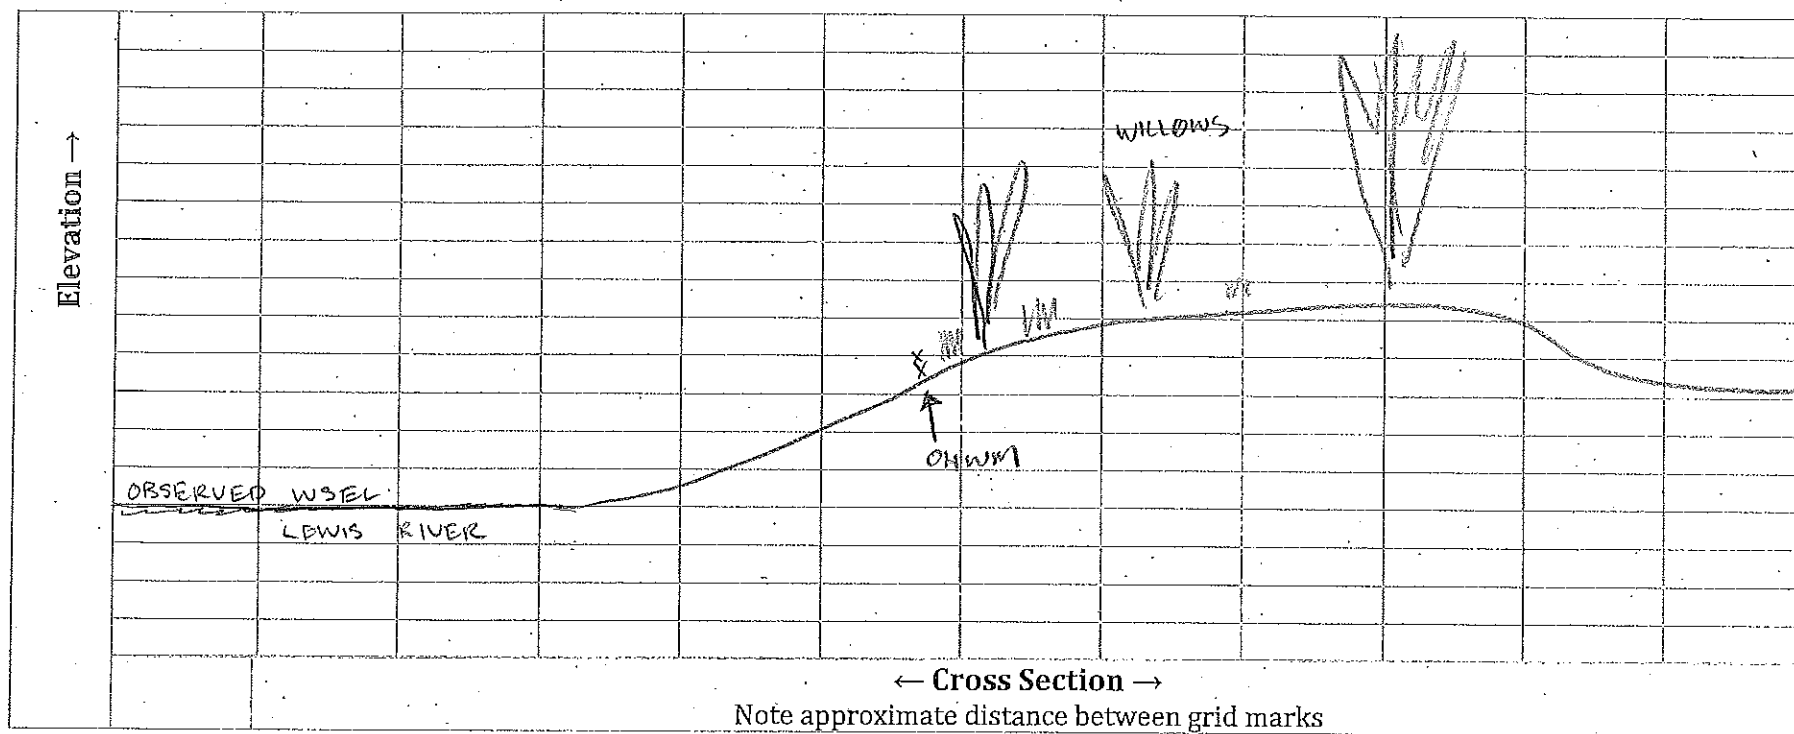

²⁴ Refer to Chapter 4 for a more complete description of indicators.

²⁵ Species are provided as examples. Refer to Appendix B for a more complete listing of plant species and their distribution across the OHWM gradient. Some species occur in more than one category depending on site conditions. For example Indian plum and red alder may straddle the OHWM where soil drainage is high. They may occur above OHWM where soil drainage is low to moderate.

	Soil and geomorphic indicators ²⁴	Vegetative indicators ²⁵	Other indicators

Notes

This survey site was at the confluence of the Lewis and Columbia Rivers. The OHWM here was not clear on any fixed objects so we used the lowest elevations of the native willows and slough sedge. Reed canarygrass was present but tolerates wet and dry conditions so it was not a useful indicator species.

Notes

This survey site was at the confluence of the Lewis and Columbia Rivers. Water levels here are highly variable as evidenced by lines of washed up debris/wrack at multiple elevations on the beach. Elevations were taken at larger wrack lines and where willows were sprouting a little higher on the beach.

MEMORANDUM

To: Jenna Kay, Planner II/Shoreline Master Program Coordinator
From: Brent Davis, Wetland and Habitat Review Manager/Shoreline Administrator *BD*
Date: January 10, 2019
Subject: REVISED Analysis to Support Proposed Shoreline Map Amendments in the Shanghai Creek Basin

Introduction

The current Shoreline Map for Clark County includes a large area in the Shanghai Creek basin that was added to the map with the 2012 Shoreline Master Program update based on the 2005 Clark County Wetland Inventory. Shanghai Creek is not a Shoreline stream pursuant to RCW 90.58.030(2)(e), but is a tributary of Fifth Plain Creek. The confluence of Shanghai and Fifth Plain creeks is the point at which Fifth Plain Creek becomes a Shoreline stream. Potential wetlands mapped in the Wetland Inventory that are contiguous with the point downstream where Fifth Plain Creek becomes a Shoreline stream were added to the Shoreline Map, including a large area in the Shanghai Creek basin on the basis that these wetlands may be associated with the Shoreline stream.

In 2016 county staff coordinated with Ecology to determine that the downstream most wetland associated with the south side of Shanghai Creek is not associated to the Shoreline due to a hydrologic break that isolates the wetland from direct interaction with the waters in Fifth Plain Creek. Furthermore, case-by-case review of wetlands entirely within the Shanghai Creek basin have yet to identify a wetland associated to the Shoreline or Shorelands.

As part of the 2020 Periodic Update to the Shoreline Master Program, I have compiled data from the review of several properties located south of Shanghai Creek that are identified on the current Shoreline Map and performed some additional field review of publicly accessible hydrologic breaks caused by the existing roads and drainage infrastructure to support the proposed removal of all areas on the Shoreline Map that are south of Shanghai Creek and entirely within the Shanghai Creek basin (the study area). In addition, I have included a small area of mapped wetlands in the Lacamas Creek basin that has been confirmed to be uplands and since been developed into residential subdivision.

Velvet Acres

Velvet Acres is a recently platted subdivision that spans the divide between Shanghai and Lacamas Creeks at the western end of the study area. There are no wetlands in this subdivision (see Attachment C-1), therefore this area can be removed from the Shoreline Management Area map as proposed in Figure 1.

BFI Subdivision

The BFI Subdivision was platted in 2010. The site was subject to a wetland delineation at the time. No wetlands were identified on portions of the plat that are overlaid with the current shoreline map. One small wetland is shown in the southwest portion of the plat that outside the current shoreline map (see Attachment C-2).

8102 NE 211th Ave.

A residential building permit for a new home was granted on this property in 2014. Wetland and Habitat Review staff determined that there are no wetlands on this property (see Attachment C-3).

8018 NE 201st Ave.

A residential building permit for a home addition was granted on this property in 2019. Wetland and Habitat Review staff identified Wetland Unit I (Figure 1) and determined that it was not associated to the Shoreline Management Area.

Mapped Wetland Inventory in the Shanghai Creek Basin

The county has identified all likely wetlands in the portion of the Shanghai Creek basin south of the channel and West of NE 222nd Ave. and determined that none of these wetlands meet the criteria to be associated with the Shoreline Management Area associated with Fifth Plain Creek. Therefore, these areas can be removed from the Shoreline Management Area map as proposed in Figure 1.

Review of Wetland Units

Since the Shoreline Master Program adoption in 2012, County biologists have reviewed projects on numerous properties in the study area (see Figure 1). Wetland units have been mapped using the assessment unit guidelines in the 2014 Wetland Rating System for Western Washington. Some units have been modified as additional sites within the unit have been evaluated. This review is based on the most current assessment unit boundaries in the study areas. Two units south of NE 83rd St. have been mapped specifically for this review without on-site verification.

1. Unit A

Unit A is the downstream most wetland in this review. The downstream hydrologic break (Figure 3A) was initially established in 2016 based on analysis prepared by a AKS Engineering & Forestry and reviewed on site by Clark County and Ecology (see Attachment A). This unit is a slope wetland isolated from influence by Shanghai Creek, except for during extreme flood events, due to vertical separation from the channel and from the SMA by vertical separation from Fifth Plain Creek and upland terrace elevated above the Flood Hazard Area (1% probability).

The upstream limits of Unit A (Figure 3B) have recently been evaluated through off-site analysis provided by Ecological Land Services, Inc. and reviewed by county biologists.

2. Unit B

Unit B (Figure 3B) is a slope wetland isolated from influence by Shanghai Creek, except for during extreme flood events, due to vertical separation from the channel and from Unit A by a lateral ditch that captures and routes all surface and shallow ground water flows to Shanghai Creek. This unit is isolated from the SMA by Shanghai Creek. The county has not had an opportunity to review this unit on-site but the west and east breaks are clearly visible in aerial photography.

3. Unit C

Unit C (Figure 3B) is a slope wetland isolated from influence by Shanghai Creek, except for during extreme flood events, due to vertical separation from the channel and from Unit B by development that prevents east to west exchanges of hydrology. This unit is isolated from the SMA by Shanghai Creek. County biologists have been on-site in Unit C to verify the slope classification eastern extents. The western hydrologic break is clearly visible in aerial photography.

4. Unit D

Unit D is a slope wetland isolated from influence by Shanghai Creek, except for during extreme flood events, due to vertical separation from the channel and from Unit C by NE 202nd Ave. This unit is isolated from the SMA by Shanghai Creek. County biologists have verified that the culvert draining this unit (Figure 3B) to the west discharges to the roadside ditch on the west side of NE 202nd Ave. which drains directly to Shanghai Creek.

5. Unit E

Unit E is a slope wetland isolated from influence by Shanghai Creek, except for during extreme flood events, due to vertical separation from the channel and from Unit D by NE 212th Ave. This unit is isolated from the SMA by Shanghai Creek. County biologists have been on-site in Unit E and have verified that the culvert draining this unit (Figure 3B) to the west discharges directionally to the Unit D with a sufficient vertical drop to create a hydrologic break.

6. Unit F

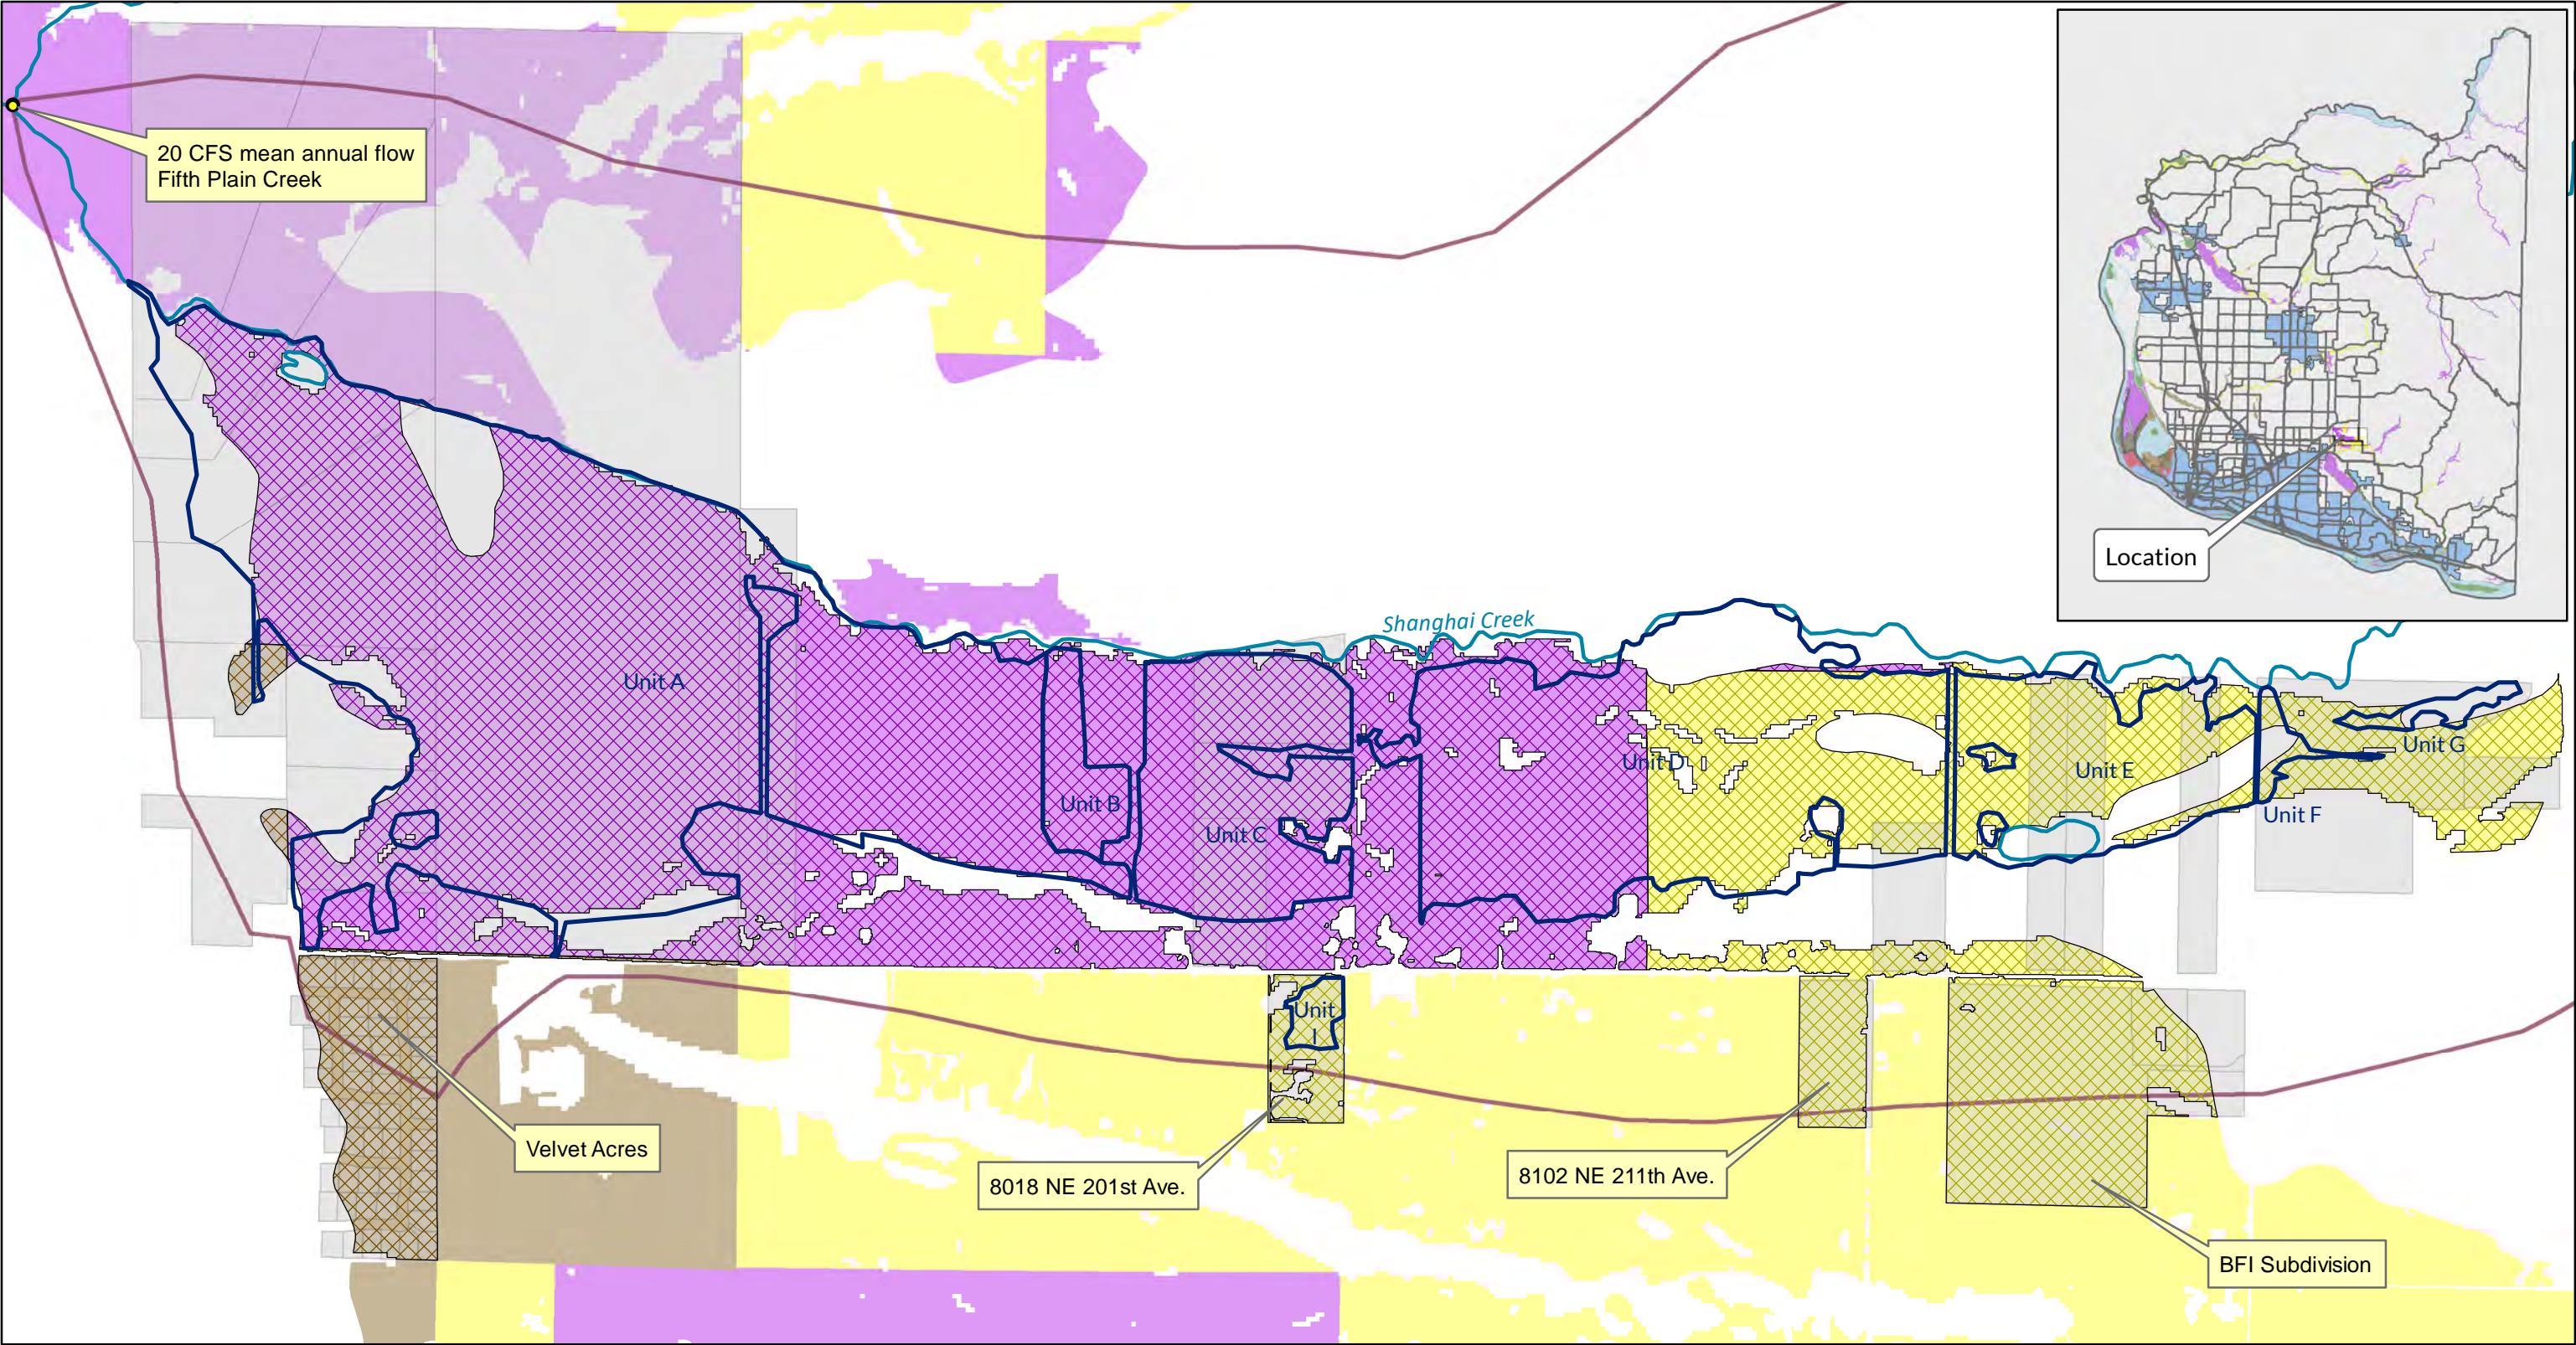

Unit F is a slope wetland isolated from influence by Shanghai Creek, except for during extreme flood events, due to vertical separation from the channel and from Unit E by a strip of upland at the western end. This unit is isolated from the SMA by uplands. County biologists have been on-site in Unit G and have verified the presence of the hydrologic break.

7. Unit G

Unit G (Figure 1) is a closed depression isolated from influence by Shanghai Creek and the SMA by uplands. This unit has been characterized by on-site review by county biologists.

8. Unit I

Unit I slope wetland isolated from influence by Shanghai Creek and the SMA by the hydrologic breaks created by the roadside ditch system along NE 83rd St. This unit has been characterized by on-site review by county biologists (see Attachment B).

IDENTIFIED HYDROLOGY FLOW

The site reconnaissance identified a total of six agriculture ditches that convey hydrology from the 4K wetland unit offsite and north to Shanghai Creek. Two ditches run north/south across the full extent of the offsite area (Ditch 1 and Ditch 2), two ditches run east/west (Ditch 3 and Ditch 4), one ditch runs north/south before turning west/northwest (Ditch 5), and one short ditch (Ditch 6) connects an agriculture pond (AG Pond) pond to Shanghai Creek. Ditch 3 has two sections, Ditch 3 West and Ditch 3 East. Ditch 3 captures hydrology from the northern portion of the onsite 4K Wetland, and conveys it north into Ditch 1.

Hydrology from the eastern portion of the wetland unit is conveyed north/northwest by Ditches 1-4. The hydrology collected by Ditches 1, 2, and 3 is conveyed north to Ditch 4, where the flow merges just prior to flowing down into the AG Pond. Ditch 6 provides a direct connection between the AG Pond and Shanghai Creek.

Hydrology from the western portion of the wetland unit is conveyed by Ditch 5. Ditch 5 is surrounded by two upland areas (Upland 1 and Upland 2). These two upland areas (262-foot contour) are approximately two to four feet higher in elevation than the adjacent wetland unit (258-foot contour), as represented by Clark County GIS topography data (Figure 2). Runoff from these upland areas flows down to the toe of the slope associated with the uplands and into Ditch 5. Ditch 5 conveys hydrology from the western portion of the wetland unit and after passing through a culvert outfalls to Shanghai Creek.

Uplands

Four upland areas were documented during the offsite reconnaissance (Figure 1). Data collected at the “sample plot” locations (SP-1, SP-2, SP-3 and SP-4) are as follows. Also see representative site photos attached of the upland areas.

Location	Soils	Vegetation	Hydrology
SP-1	10YR 4/4, 0-16"	Douglas-fir Orchard grass Himalayan blackberry Common dandelion Common buttercup	None
SP-2	10YR 4/4, 0-16"	AG pasture grass	None
SP-3	10YR 3/4, 0-16"	AG pasture grass	None
SP-4	10YR 3/4, 0-16"	AG pasture grass	None

Ditch Measurements

The below table documents the width and depth of the offsite AG Ditches as documented during the site reconnaissance. The length and width data for the ditches was collected in order to document the size of the ditches, as well as provide an indicator of the approximate flow volume that seasonally flows through the wetland unit. Also see representative site photos attached of the Ditches.

Location	Data Point	Width (feet)	Depth (inches)	Notes:
Ditch 3	1	2	6	West portion of Ditch 3

IDENTIFIED CHANGES IN ELEVATION

Survey Data Collection

The elevations of three points along the 4K northern boundary were surveyed. Additionally, the elevations of seven points across offsite locations were surveyed. The seven offsite points were surveyed in an effort to document the change in elevation within the wetland unit, and along Shanghai Creek. The survey points were identified locations in the field where hydrology flow patterns were observed to change, or drop in elevation, and therefore generally change from bi-directional flow to unidirectional flow. The elevations of the points were surveyed with a laser level. The northwest corner of the 4K parcel was used as the baseline point for the survey.

Survey Point Locations	Baseline Elevation (ft.)	Relative Elevation	Difference in Elevation Between Points
E1 (NW property corner of 4K property)	2.02 (at E1)	0 (at baseline)	
E2 (mid-point of N. 4K parcel boundary)		-0.78	
E3 (NE property corner of 4K property)		-2.26	
E4 (Northern extent of Ditch 1)		-8.18	-1.4'
E5 (Eastern edge of AG Pond at Ditch 4)		-9.58	
E6 (AG Pond)		-9.20	-1.82'
E7 (Top of Break 1 – Shanghai Cr.)		-11.02	
E7 (Top of Break 1 – Shanghai Cr.)		-11.02	-2.02' (Break 1)
E7 (Bottom of Break 1 – Shanghai Cr.)		-13.04	
E8 (Top of Break 2 – Shanghai Cr.)		-13.94	-1.03' (Break 2)
E8 (Bottom of Break 2 – Shanghai Cr.)		-14.97	
E8 (Bottom of Break 2 – Shanghai Cr.)		-14.97	-0.17'
E9 (Confluence of Shanghai Creek and Fifth Plain Creek/Upper Fifth Plain Creek)		-15.14	
Totals		-15.14	-6.27

The total difference across the points listed represents the change in elevation from the point within the wetland unit where bi-directional flow changed to unidirectional flow. The unidirectional flow of Shanghai Creek would need to gain over 6 feet in elevation to reach the bi-directional flow area of the wetland unit.

Survey Data Collection Summary

At point E7, a change of over 2 feet was documented (-2.07'). At point E8, a change of an additional 1-foot was documented (-1.03'), with another 0.17' drop documented at the confluence of Shanghai Creek and Fifth Plain Creek. This data shows that within approximately 1,800 feet east of the confluence of Fifth Plain Creek (Type S), Shanghai Creek (Type F) increases in elevation by 3.22 feet. These documented changes in elevation along Shanghai Creek are considered significant, and therefore represent a break in hydrology between the Type S water (shoreline) and the Type F water. See representative site photos attached documenting the elevation survey points and Break 1 and Break 2.

Hydrology Flow Direction

The elevation survey documented a drop in elevation of 9.58' from the 4K northwestern property corner (E1) to the eastern boundary of the offsite pond (E5). Due to this change in elevation from west to east, a portion of the onsite 4K wetland hydrology flows to the northeast property corner and out to Ditch 1. The lowest elevation within the wetland unit across the open field north of the 4K property is generally the 260-foot elevation contour. The elevation drops from the wetland in the field by approximately 2 feet to the water level within Shanghai Creek.

The hydrology flow directions are depicted on Figure 2 (4K Shorelines JD Topo Map) for the onsite and offsite portions of the wetland unit associated with the 4K wetland. The ditches combined with the presence of two upland areas (Upland 1 and Upland 2) located above the 256-foot elevation contour (Figure 2) help to convey the wetland hydrology to two main points along the southern bank of Shanghai Creek. These points are depicted on Figure 1 and 2 as "E6" and "E7."

SUMMARY

Identified Breaks

The offsite reconnaissance determined that the 4K Wetland hydrologically generally flows to the north (offsite) through historic agriculture ditches. The slope documented across the offsite field, north of the 4K site, is generally 1 percent (north to south) and the hydrology is therefore allowed to generally flow bi-directionally across this open field and the ditches. When Ditches 1-3 join and flow into Ditch 4, there is unidirectional flow west until the hydrology drops to the AG Pond. The fall into the AG Pond (survey points E4 to E6) documents a drop in elevation of approximately 1.02 feet, or 9.58 feet below that of the 4K Wetland. The pond is separated from Shanghai Creek by a berm approximately 4 feet tall. The AG Pond is a temporary settling point (or bi-directional flow) for the hydrology, as Ditch 5 allows a direct connection to the Shanghai Creek from the AG Pond. Once the hydrology leaving the AG Pond flows out to Shanghai Creek, the flow is again unidirectional, flowing west.

West of the AG Pond, two changes in elevation within the main channel of Shanghai Creek were observed and documented at survey points; E7 top/E7 bottom, and E8 top/E8 bottom. The change in elevation between the AG Pond (E6) and E7 top was -1.82 feet. From E7 top to E7 bottom the change in elevation was -2.02'. This change in the water elevation of over two feet was considered significant, and documented as "Break 1" (Figure 1)

The change in elevation between E8 top and E8 bottom was -1.03'. This change in the water elevation of over one foot within the main channel of Shanghai Creek was considered significant, and documented as "Break 2".

The overall difference in elevation documented between Ditch 4 within the wetland unit (the location where bi-directional flow is lost), to survey point E8 bottom (Break 2) is over six feet. The elevation difference and the loss of bi-directional flow across this area is considered significant enough to be considered a "break" in the wetland hydrology between the 4K Wetland and Shanghai Creek, and the downstream Shoreline waters of the state (Fifth Plain Creek). Therefore, the criteria for associated wetlands is not met, and the 4K wetland unit can be separated from that of the Fifth Plain Creek Shoreline designation.

Associated wetlands are defined as *"those wetlands which are in proximity to and either influence or are influenced by waters of a lake, river or stream subject to the SMA."*

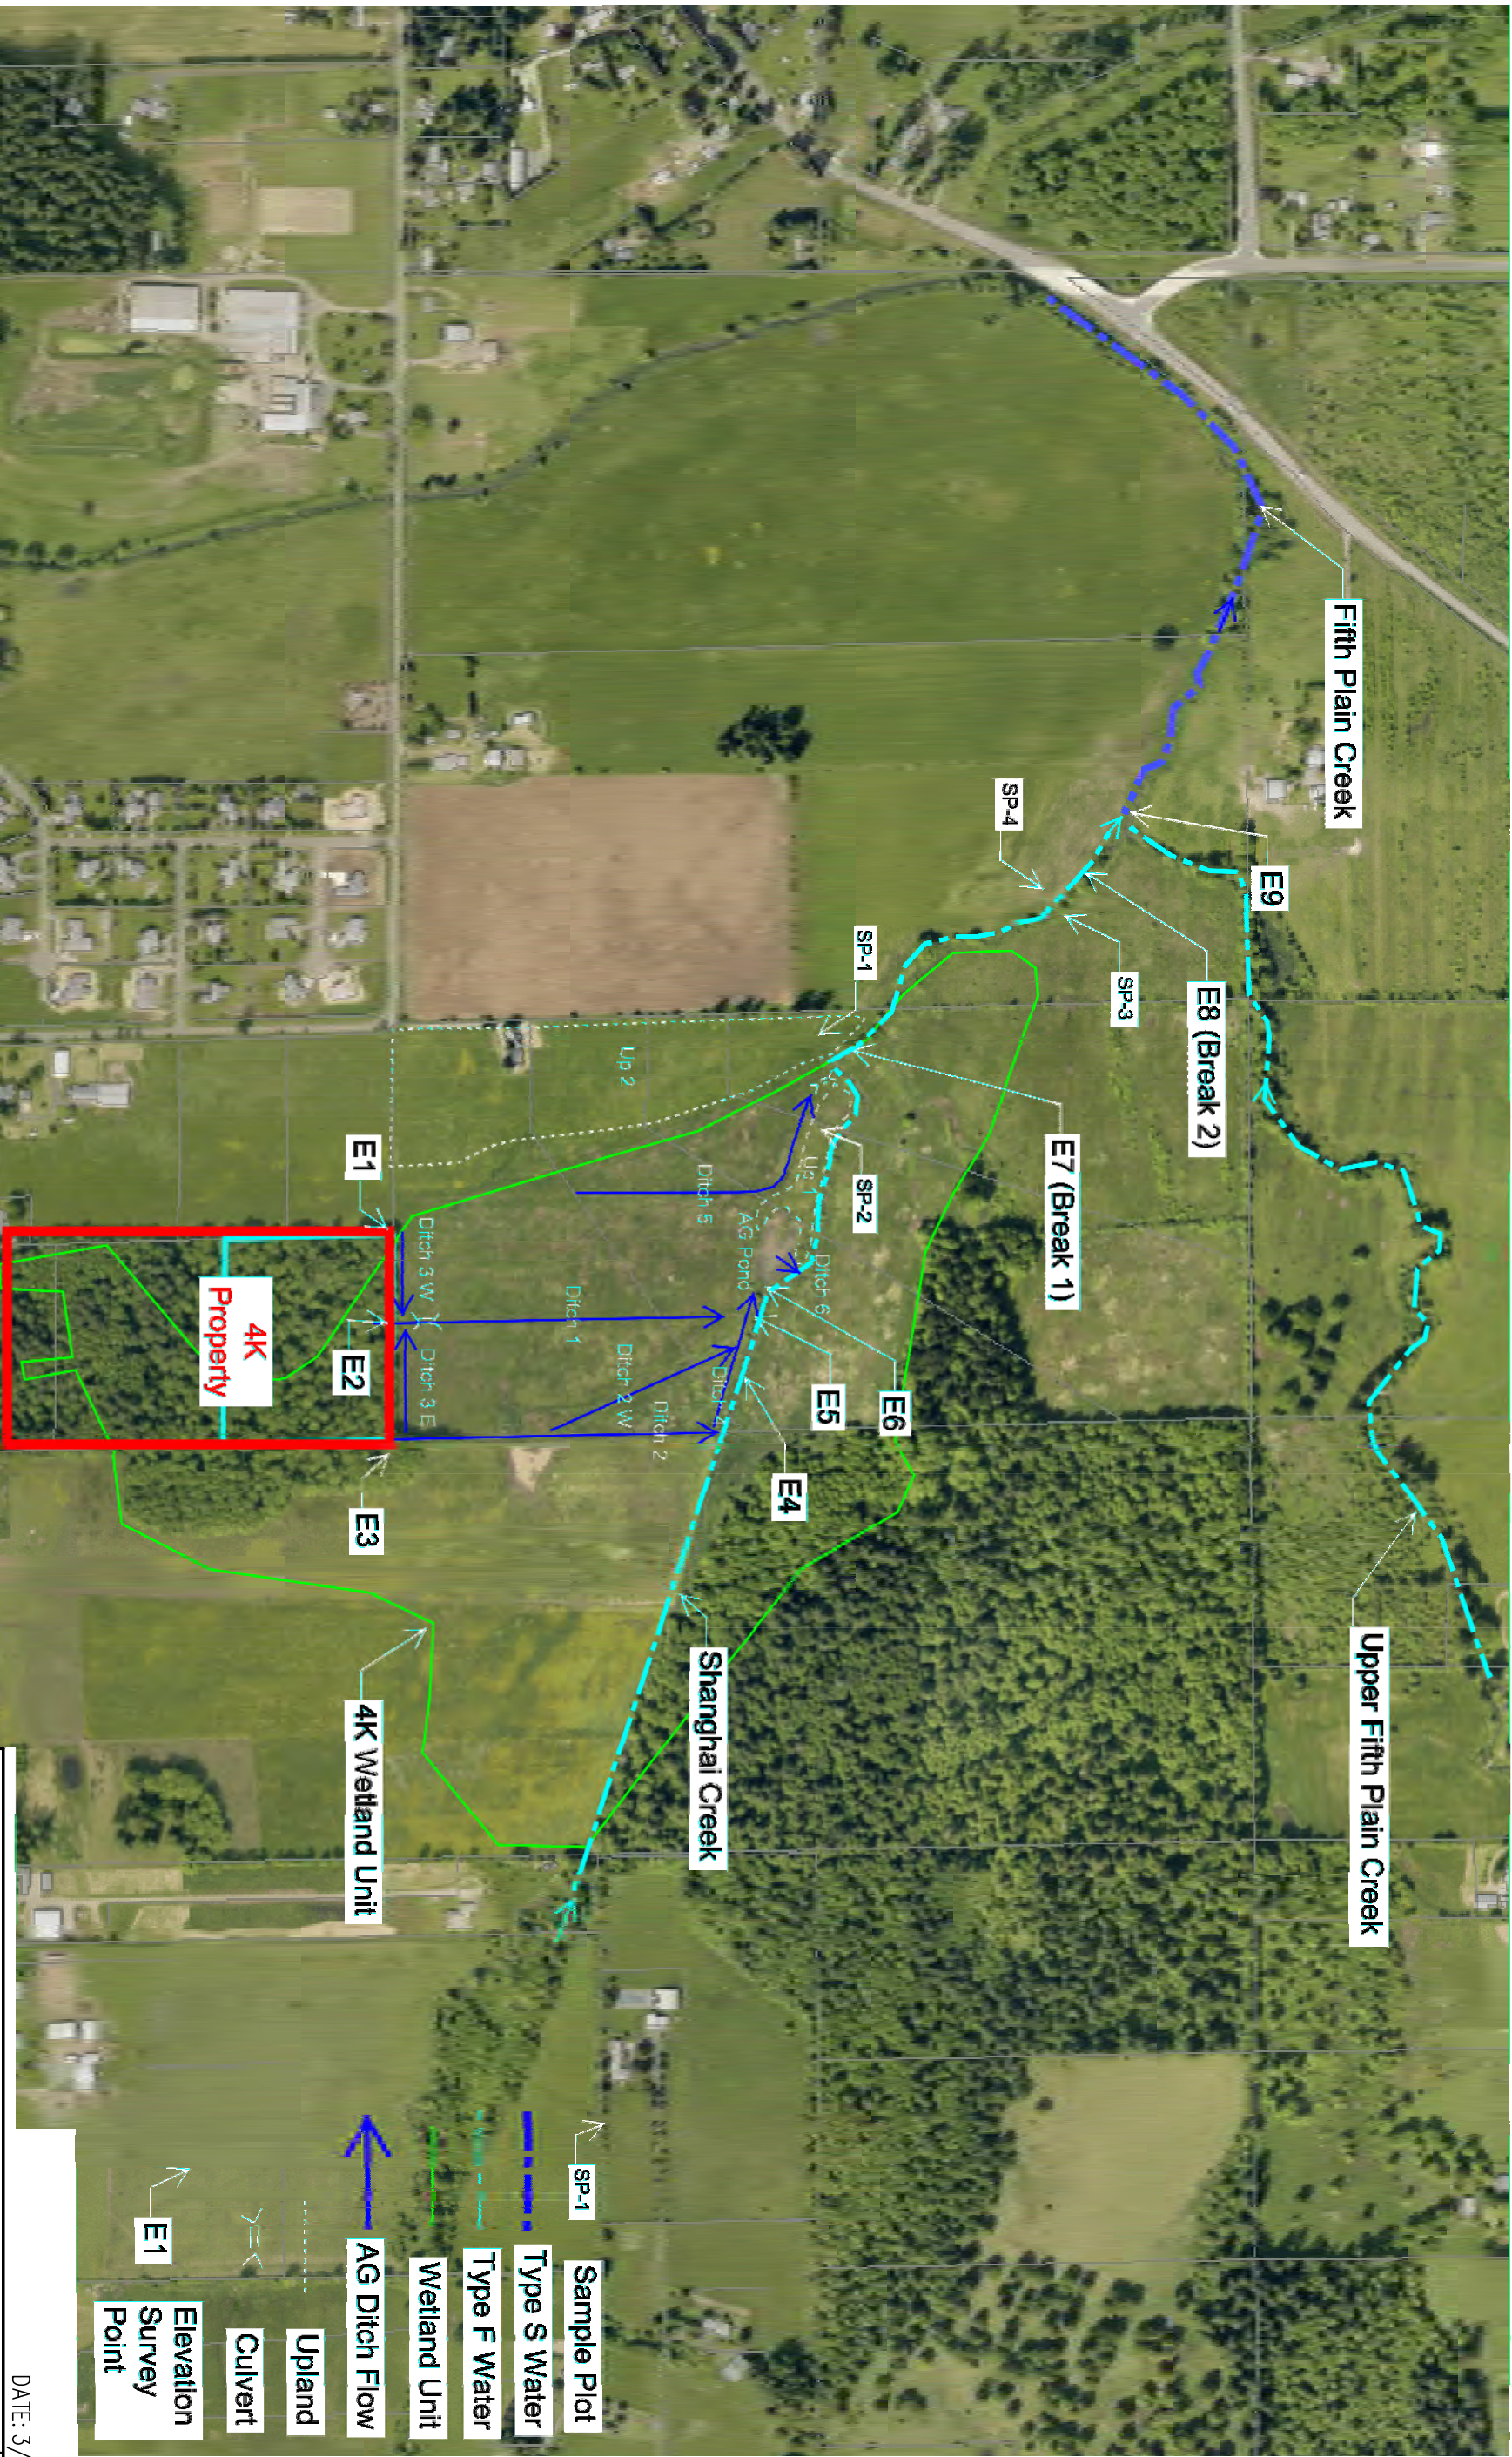

The 4K Wetland hydrology is conveyed to Shanghai Creek and the Shoreline waters of the state (and therefore influences it), but the "Shoreline waters" do not flow bi-directionally up to the 4K wetland unit, and therefore the 4K Wetland is not influenced by "Shoreline waters."

For this reason, the 4K Wetland does not meet the criteria for an associated wetland, and should not be considered a Shoreline of the state, and should not be regulated by the Shoreline Management Act (SMA).

Proposed addition avoids wetland buffers (see attached map). The wetland is within the subwatershed for Shanghai Creek. There is a hydrologic break for the wetland at NE 83rd Street; additionally a hydrologic break was established for Shoreline for Shanghai Creek further to the north and west. The wetland is found to not be associated with Shoreline; no further wetland review required.

The proposed septic addition appears to avoid the drip line of the Oregon white oak onsite. If this changes and impacts are drip line of the oak is impacted then additional habitat review may be required.
